PitCrew

Prepared response for data center teams

Sector agents investigate developing issues.
Technicians arrive with the evidence and keep it through every handoff.

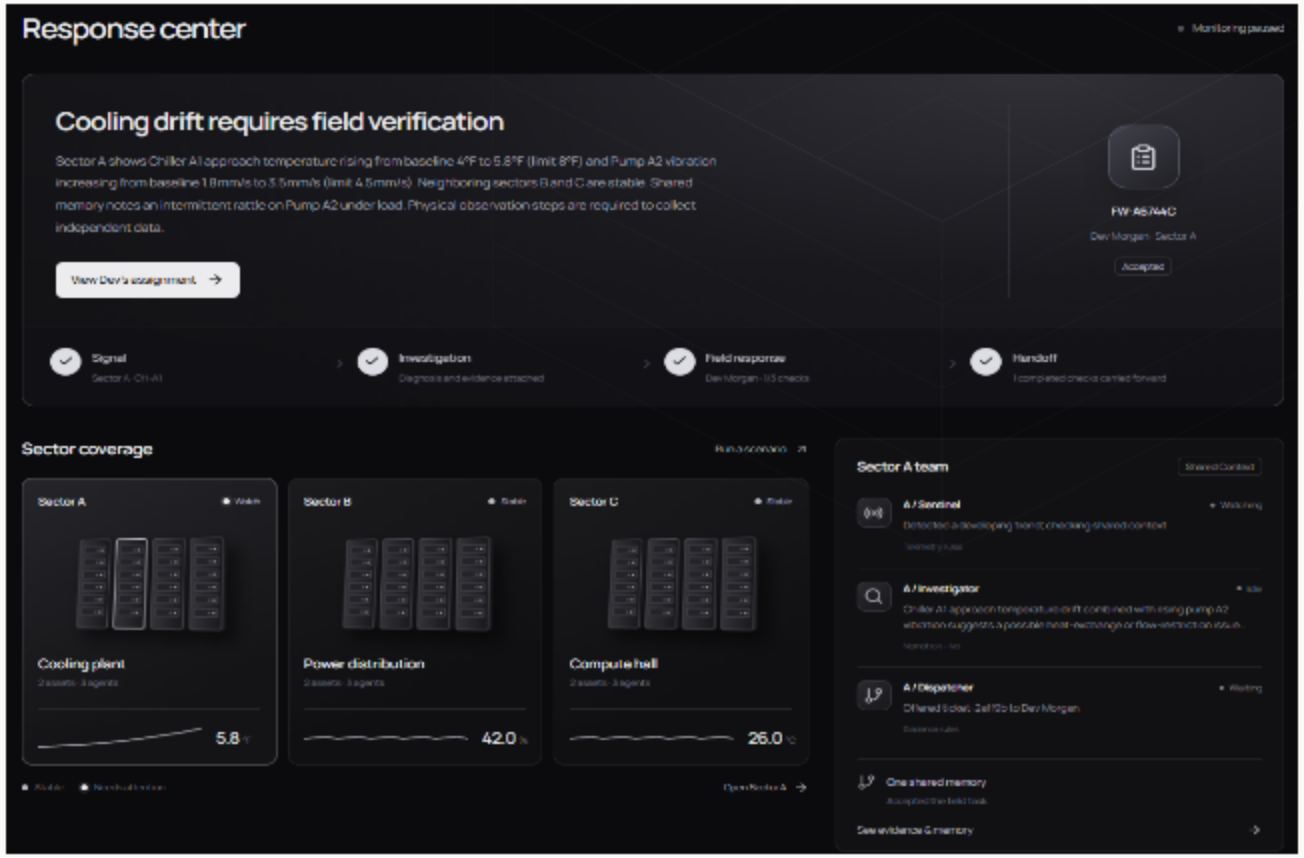

The first visit starts with evidence

A developing cooling fault

The investigator compares the trend with nearby sectors and the previous shift’s observations.

The dispatcher offers physical checks to a qualified sector responder with the right tools and access.

Proximity uses a sector check-in.

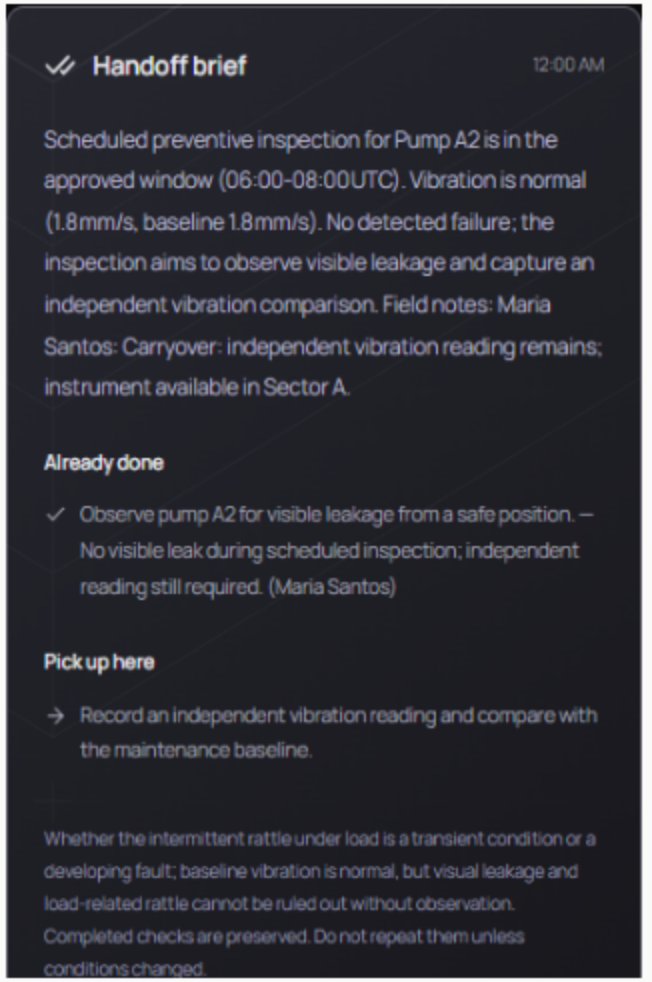

The next responder keeps the context

Maria records a field check.

Dev receives her finding, completed work, remaining checks and unresolved questions.

Shared history also informs upkeep.

The team checks maintenance readiness before a due date and keeps blocked work visible.

Nemotron works through real tools

Investigator

Reads vitals, neighboring sectors, maintenance plans and sector memory.

propose_diagnosis
write_shared_memory

Dispatcher

Reads the new case, shared memory and eligible responders.

The server enforces qualifications and approved work.
Every tool call leaves an inspectable record.

The three-minute demonstration

1 **Prepared cooling case**

Review the diagnosis and saved live tool calls.

2 **One phone check**

Accept the assignment and record a field observation.

3 **Preserved handoff**

The next technician sees findings and unfinished work.

4 **Shift readiness**

A brief view of the shift report and upcoming maintenance.

Synthetic facility data. Real model tool calls. No plant actuation.
